Art Unit: 2816

1. Claim 1 is objected to because of the following informalities: on line 1, "the direct current consumption circuit" lacks antecedent basis, as does "the macro circuit" on line 3, "the direct current" on line 5, and "the stop signal" on line 6. Appropriate correction is required.

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claim 1 is rejected under 35 U.S.C. 102(b) as being anticipated by Aneha et al.

Note Fig. 1, where the recited DC consumption circuit including the reference voltage generator reads on circuit 27; the recited macro circuit reads on all of the other circuitry in Fig. 1; the recited power supply reads on battery 10; the recited first switching circuit reads on main switch 22 (it receives a stop signal from inverter IN2 when it is to be turned off); the recited second switching circuit reads on any of the (inherent) switches inside counter 25; and the recited start

Art Unit: 2816

signal generator reads on circuit 24 (which outputs a start signal).

As an alternative interpretation of Aneha et al's Fig. 1, the signal AC output from logic circuit 29 can be interpreted as the stop signal (any switch inside MPU 28 which receives it and causes main switch 22 to go off is the recited first switching circuit); and the control input signal which causes switch 21 to close can be interpreted as the start signal.

3. Claims 2-5 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Each of the remaining references cited on the attached PTOL-892 is also seen to anticipate claim 1, i.e., each discloses a reference generator circuit and switching circuits which respond to separate start-up and stop signals.

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kenneth B. Wells whose telephone number is (571)272-1757. The examiner
